

UNIFORM LOCAL EXISTENCE FOR INHOMOGENEOUS ROTATING FLUID EQUATIONS

MOHAMED MAJDOUB AND MARIUS PAICU

ABSTRACT. We investigate the equations of anisotropic incompressible viscous fluids in $\mathbb{R}^3$, rotating around an inhomogeneous vector $B(t, x_1, x_2)$. We prove the global existence of strong solutions in suitable anisotropic Sobolev spaces for small initial data, as well as uniform local existence result with respect to the Rossby number in the same functional spaces under the additional assumption that $B = B(t, x_1)$ or $B = B(t, x_2)$. We also obtain the propagation of the isotropic Sobolev regularity using a new refined product law.

1. INTRODUCTION

The aim of this work is to investigate the well-posedness theory of inhomogeneous rotating fluids in the framework of Sobolev spaces. We consider the equations governing incompressible, viscous fluids in $\mathbb{R}^3$, rotating around an inhomogeneous vector $B(t, x_h) = (b_1(t, x_h), b_2(t, x_h), b_3(t, x_h))$ where x_h stands for the horizontal variables (that is $x = (x_h, x_3)$). This is a generalization of the usual rotating fluid model, where $B = e_3 := (0, 0, 1)$. More precisely, we are interested in the following system

$$(IRF^\varepsilon) \begin{cases} \partial_t u^\varepsilon + (u^\varepsilon \cdot \nabla) u^\varepsilon - \nu_h \Delta_h u^\varepsilon - \nu_v \partial_{x_3}^2 u^\varepsilon + \frac{1}{\varepsilon} (u^\varepsilon \times B) + \nabla p^\varepsilon = 0 & \text{in } \mathbb{R}^3 \\ \operatorname{div} u^\varepsilon = 0 & \text{in } \mathbb{R}^3 \\ u^\varepsilon(0, x) = u_0(x) \end{cases}$$

where u is the velocity field and p is the pressure. The constants $\nu_h > 0$, $\nu_v \geq 0$ and $\varepsilon > 0$ represent respectively the horizontal viscosity, the vertical viscosity and the Rossby number. We have written $\Delta_h = \partial_1^2 + \partial_2^2$ and $(u \cdot \nabla)u = \sum_{j=1}^3 u_j \partial_j u$ where $u = (u_1, u_2, u_3)$ and ∂_j represents the partial derivative in the direction x_j . We will also write $\nabla_h = (\partial_1, \partial_2)$ and $\operatorname{div}_h u = \partial_1 u_1 + \partial_2 u_2$. Throughout this article, B will be a smooth function with bounded derivatives. Additional assumptions on B will be made later.

Before going any further, let us recall some well-known facts about the constant case $B = e_3$. There is a large literature dealing with these equations in the constant case. The first results for systems with large skew-symmetric perturbations are contained in [23], [21], [22]. In [1], A. Babin, A. Mahalov and B. Nicolaenko studied the incompressible rotating Euler and Navier-Stokes equations on the torus. Using the method introduced by S. Schochet (see [30] and [31]), I. Gallagher studied in [11] and [12] this problem in its abstract hyperbolic form. In the case of the incompressible rotating Navier-Stokes equations on the torus, it is shown (see [1] and [16]) that the solutions exist globally in time and converge to a solution of some diffusion equation. The case of rotating fluids evolving between two horizontal plates with Dirichlet boundary conditions was studied by E. Grenier and N. Masmoudi [17] (see also the paper of N. Masmoudi [25] and the recent work of J.-Y. Chemin, B. Desjardin, I. Gallagher and E. Grenier [8]). Motivated by this case, J.-Y. Chemin *and al.* studied the incompressible fluids with anisotropic viscosity in the whole space in [7] and [8]. They obtained local existence of the solution in the anisotropic Sobolev spaces $H^{0,1/2+\eta}(\mathbb{R}^3)$ and the global existence for data which are small compared to the horizontal viscosity. They also proved the global existence of the solution for anisotropic rotating fluids. The key of their proof is an anisotropic version of Strichartz estimates. In [27], global existence of the solution for rotating fluids with vanishing vertical viscosity was shown in the periodic case. Finally, we also refer to the related works [2], [4], [9] and [15].

In both constant and non constant cases, if $\nu_v > 0$, it is easy to construct global weak solutions. This is simply due to the fact that the singular perturbation is a linear skew-symmetric operator. The behavior of these solutions (as $\varepsilon \rightarrow 0$) has been studied by I. Gallagher and L. Saint-Raymond in a recent paper [13]. It is proved in [13] that the weak solutions u^ε converge to the solution of a heat equation

when the vector field B is non stationary. The proofs of [13] are based on weak compactness arguments. For a detailed analysis of the rotating geophysical fluids we refer to [14].

In this paper, we would like to investigate the question of existence of strong solutions for (IRF^ε) . Our aim is to prove the existence and uniqueness of a solution on a uniform time interval, or the global existence and uniqueness for small initial data. To do so we need an energy estimate in Sobolev spaces as in [10]. Unfortunately one sees quickly that this is not an easy matter just by taking horizontal derivatives of the equation. But since B does not depend on the third variable, all vertical derivatives are allowed in the energy estimate. Only horizontal derivatives create extra terms. So the idea is to start by taking the initial data in an anisotropic-type Sobolev space. Such spaces have been introduced by Iftimie in [18] and are very useful for anisotropic problems (see also [7], [19, 20], [26, 27]). Using the skew-symmetry of the Coriolis operator in the anisotropic Sobolev space $H^{0,s}$ (see Definition 2.2 below) and some product laws we shall prove the global existence and uniqueness for small data in $H^{0,s}$ for $s > 1/2$.

The next step consists in proving uniform local existence and uniqueness for large data in the same anisotropic Sobolev space. For technical reasons, we are not able to prove such result in the general case but only under the assumption that the rotation vector depends on one space variable. Let us remark that this assumption on B is consistent with some models of geophysical flows (see [14]).

Once these steps are achieved, we return to the propagation of the isotropic Sobolev regularity. This is a delicate problem due to the lack of vertical viscosity. The major difficulty is to estimate the term $\langle (u \cdot \nabla)u, u \rangle_{H^s}$ in a good way. In the third section we obtain a new refined product law (see Lemma 3.1) which enables us to propagate the H^s regularity as claimed in Theorems 1.3, 1.4 and 1.5.

1.1. Statement of the results. Our first result is the global existence of solutions of (IRF^ε) in suitable anisotropic Sobolev spaces when the initial data are small enough.

Theorem 1.1. *Assume that $B = B(t, x_1, x_2)$. Let $s > 1/2$ be a real number and u_0 be a divergence-free vector field in $H^{0,s}(\mathbb{R}^3)$. Assume that $\|u_0\|_{H^{0,s}} \leq c\nu_h$ where c is small enough. Then, there exists a unique global solution u^ε of (IRF^ε) such that*

$$u^\varepsilon \in C_b(\mathbb{R}_+; H^{0,s}) \quad \text{and} \quad \nabla_h u^\varepsilon \in L^2(\mathbb{R}_+; H^{0,s}).$$

Moreover, for any $t \geq 0$,

$$\|u^\varepsilon(t)\|_{H^{0,s}}^2 + 2\nu_h \int_0^t \|\nabla_h u^\varepsilon(\tau)\|_{H^{0,s}}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2.$$

The proof of this theorem involves no real difficulties if one takes into account the earlier results of [26]. It is based on the following simple fact

$$\langle u \times B(t, x_h), u \rangle_{H^{0,s}} = 0.$$

The next theorem gives the local existence, uniformly in ε , in the space $H^{0,s}$ when the rotation vector only depends on one space variable, say x_1 .

Theorem 1.2. *Assume that $B = B(t, x_1)$. Let $s > 1/2$ be a real number and $u_0 \in H^{0,s}(\mathbb{R}^3)$ be a divergence-free vector field. Then, there exists a positive time T such that, for all $\varepsilon > 0$, the system (IRF^ε) has a unique solution u^ε such that*

$$u^\varepsilon \in \mathcal{C}([0, T], H^{0,s}) \quad \text{and} \quad \nabla_h u^\varepsilon \in L^2([0, T], H^{0,s}).$$

The assumption on B made in this theorem seems to be physical. Indeed, in the literature, B usually depends only on one variable, for example $B = (1 + \beta x_2)e_3$, where x_2 is the latitude variable and β is a parameter. Let us explain briefly the mathematical reasons for the assumption made on B . Generally speaking, we can prove local existence of the solution as long as we can prove that the solution of the linear part of the equation stays uniformly small in a short time. In the general case ($B = B(t, x_1, x_2)$), we can prove only that the solution of the linear corresponding equation is bounded, but we cannot prove that the solution is small for short time. Contrary to this situation, if $B = B(t, x_1)$ or $B = B(t, x_2)$ we can prove that the solution of the linear problem is small in uniformly small time and so we can prove the uniformly local existence result.

Theorem 1.2 is not completely satisfactory, since the initial data belongs to an anisotropic Sobolev space which is adapted to the equation. A natural question to ask is then the following: is it possible to propagate the isotropic Sobolev regularity?

Let us first consider the particular case $B \equiv 0$, that is, the case of the anisotropic Navier-Stokes equations.

$$(NS_h) \begin{cases} \partial_t u + u \cdot \nabla u - \nu_h \Delta_h u + \nabla p = 0 \\ \operatorname{div} u = 0 \\ u(0, x) = u_0(x) \end{cases}$$

This system was studied in [7], where the local existence for arbitrary initial data and global existence for small initial data in $H^{0,s}(\mathbb{R}^3)$ for $s > 1/2$ and uniqueness for $s > 3/2$ are proved. In [20], the author filled the gap between existence and uniqueness and proved that uniqueness holds when existence does; that is for $s > 1/2$. In the third section we will prove the following theorem which can be seen as a propagation of the isotropic Sobolev regularity in time.

Theorem 1.3. *Let $s > 1/2$ be a real number, and let $u_0 \in H^s(\mathbb{R}^3)$ be a divergence-free vector field. There exists a positive time T and a unique solution u of (NS_h) defined on $[0, T] \times \mathbb{R}^3$ such that*

$$u \in \mathcal{C}([0, T]; H^s) \quad \text{and} \quad \nabla_h u \in L^2([0, T]; H^s).$$

If the maximal time T^* of existence is finite, then

$$\lim_{t \rightarrow T^*} \int_0^t \|\nabla_h u(\tau)\|_{L_v^\infty(L_h^2)}^2 (1 + \|u(\tau)\|_{L_v^\infty(L_h^2)}^2) d\tau = +\infty.$$

Furthermore, there exists a positive constant c such that if $\|u_0\|_{H^s} \leq c \nu_h$, then the solution is global in time.

The fact that the lack of vertical viscosity prevents us from gaining vertical regularity is the main difficulty in the proof of Theorem 1.3. The main tool to overcome

this serious difficulty is a new refined product law stated in Section 3 (see Lemma 3.1) and proved in Section 6.

From this theorem we derive the following two results. The first one concerns the propagation of the isotropic Sobolev regularity for (IRF^ε) . The second one concerns the uniform local existence in the isotropic Sobolev space.

Theorem 1.4. *Let $s > 1/2$ be a real number. There exists $c > 0$ small enough such that, for any divergence-free vector field $u_0 \in H^s(\mathbb{R}^3)$ with $\|u_0\|_{H^s} \leq cv_h$, and for any $\varepsilon > 0$, the system (IRF^ε) has a unique global solution u^ε such that*

$$u^\varepsilon \in \mathcal{C}(\mathbb{R}_+; H^s(\mathbb{R}^3)) \cap L_{loc}^\infty(\mathbb{R}_+; H^s(\mathbb{R}^3)) \quad \text{and} \quad \nabla_h u^\varepsilon \in L_{loc}^2(\mathbb{R}_+; H^s(\mathbb{R}^3)).$$

Theorem 1.5. *Assume that $B = B(t, x_1)$. Let $s > 1/2$ be a real number, and let $u_0 \in H^s(\mathbb{R}^3)$ be a divergence-free vector field. Then, there exists a positive time T such that, for all $\varepsilon > 0$, the system (IRF^ε) has a unique solution u^ε satisfying*

$$u^\varepsilon \in \mathcal{C}([0, T]; H^s) \quad \text{and} \quad \nabla_h u^\varepsilon \in L^2([0, T]; H^s).$$

Remark 1.1. We point out that all the results stated above still holds in the periodic case. The proofs are similar except for some technical differences (see [28]).

The structure of the paper is as follows: Section 2 contains some notations and technical results which will be used in the whole paper. The third section deals with the propagation of the isotropic Sobolev regularity for the anisotropic Navier-Stokes equations. Section four is devoted to the proofs of global existence results for small initial data. In the fifth section, we give the proofs of the uniform local existence theorems. Section six deals with the proof of the main product law stated in the third section (see Lemma 3.1). Finally, the appendix is devoted to the proofs of some technical lemmas and product laws, which are more or less contained in earlier papers. For the sake of completeness we give their proofs here.

2. NOTATIONS AND TECHNICAL LEMMAS

In view of the anisotropy of the problem, we shall have to use functions spaces that take into account this anisotropy. The main tools will be the energy estimate and anisotropic Sobolev spaces. Such spaces have been introduced by Iftimie in [18] and used by several authors (see for instance [26, 27]-[7]-[19, 20]).

The definition of these spaces requires an anisotropic dyadic decomposition in the Fourier spaces. Let us first recall the isotropic Littlewood-Paley theory. We refer to [6] for a precise decomposition of the Fourier space.

2.1. Isotropic Littlewood-Paley theory. The main idea is to localize in frequencies. The interest of this theory consists in the fact that it allows us to define, at least formally, the product of two distributions as para-products and remainder.

Consider two smooth, compactly supported functions φ and χ , with support respectively in a fixed ring of $\mathbb{R}$ far from the origin, and in a fixed ball containing the origin and such that

$$\forall s \in \mathbb{R} \setminus \{0\}, \quad \sum_{j \in \mathbb{Z}} \varphi(2^{-j}s) = 1 \quad \text{and} \quad \forall s \in \mathbb{R}, \quad \chi(s) + \sum_{j \in \mathbb{N}} \varphi(2^{-j}s) = 1$$

Let us note that there exists an integer N_0 such that if $|j-k| \geq N_0$, then $\text{supp } \varphi(2^{-j}\cdot) \cap \varphi(2^{-k}\cdot) = \emptyset$.

Next, we define the following operators of localization in Fourier space:

$$\begin{aligned} \text{if } j \geq 0, \quad \mathcal{F}(\Delta_j u)(\xi) &= \varphi(2^{-j}|\xi|)\mathcal{F}(u)(\xi) \\ \mathcal{F}(\Delta_{-1} u)(\xi) &= \chi(|\xi|)\mathcal{F}(u)(\xi) \\ \Delta_j u &= 0 \quad \text{for } j < -1 \end{aligned}$$

where

$$\mathcal{F}(u)(\xi) = \hat{u}(\xi) = \int_{\mathbb{R}^3} e^{-i x \cdot \xi} u(x) dx, \quad \xi = (\xi_1, \xi_2, \xi_3) := (\xi_h, \xi_3) \in \mathbb{R}^3$$

is the Fourier transform of the function u .

We recall also the definition of the anisotropic Lebesgue spaces:

Definition 2.1. We denote by $L_h^p(L_v^r)$ the space $L^p(\mathbb{R}_{x_1} \times \mathbb{R}_{x_2}; L^r(\mathbb{R}_{x_3}))$ endowed with the norm

$$\|f\|_{L_h^p(L_v^r)} = \left\| \|f(x_h, \cdot)\|_{L_{x_3}^r} \right\|_{L_{x_1, x_2}^p}.$$

In the same way, we define $L_v^r(L_h^p)$ to be the space $L^r(\mathbb{R}_{x_3}; L^p(\mathbb{R}_{x_1} \times \mathbb{R}_{x_2}))$ endowed with the norm

$$\|f\|_{L_v^r(L_h^p)} = \left\| \|f(\cdot, x_3)\|_{L_{x_1, x_2}^p} \right\|_{L_{x_3}^r}.$$

The operators Δ_j satisfy the following property:

Lemma 2.1. *The operator Δ_j is uniformly bounded in $L_v^p L_h^r$ for all $1 \leq qp \leq \infty$ and $1 \leq r \leq \infty$.*

Lemma 2.2. *There exists a positive constant C such that, for every $a \in \mathcal{S}'(\mathbb{R}^3)$ with $\nabla a \in L_v^\infty(L_h^s)$ and $b \in L_v^p(L_h^t)$*

$$\left\| [\Delta_j; a]b \right\|_{L_v^p L_h^r} \leq C 2^{-j} \|\nabla a\|_{L_v^\infty L_h^s} \|b\|_{L_v^p L_h^t}$$

where $1/r = 1/s + 1/t$, $1 \leq p \leq \infty$ and $[\Delta_j; a]b = \Delta_j(ab) - a\Delta_j b$.

Lemma 2.3. *There exists a positive constant C such that, for every $a \in \mathcal{S}'(\mathbb{R}^3)$, for $j \geq 0$, $1 \leq p \leq \infty$ and $1 \leq r \leq \infty$, we have*

$$\|\Delta_j a\|_{L_v^p L_h^r} \leq C 2^{-j} \|\Delta_j \nabla a\|_{L_v^p L_h^r}.$$

The proofs of Lemmas 2.1, 2.2 and 2.3 are essentially contained in [26] (see also [5] for a more general setting). For the sake of completeness we give the proofs in the Appendix.

We recall now Bony's decomposition [3]. It is well known that the dyadic decomposition is useful for defining the product of two distributions. Formally, we can

write, for any two distributions u and v

$$u = \sum_q \Delta_q u \quad ; \quad v = \sum_q \Delta_q v \quad \text{and} \quad uv = \sum_{q,q'} \Delta_q u \Delta_{q'} v.$$

We split this sum into three terms

$$uv = T_u v + T_v u + R(u, v),$$

where we have denoted

$$\begin{aligned} T_u v &= \sum_{q' \leq q-2} \Delta_{q'} u \Delta_q v = \sum_q S_{q-1} u \Delta_q v \\ R(u, v) &= \sum_q \sum_{j \in \{0, \pm 1\}} \Delta_q u \Delta_{q+j} v. \end{aligned}$$

In the first term, the frequencies of u are smaller than those of v . In the second term, the frequencies of v are smaller than those of u . In the third term, the frequencies of u and v are comparable. The first two sums are called the para-products and the third sum is the remaining term.

We have the following quasi-orthogonality properties

$$\Delta_q (S_{q'-1} u \Delta_{q'} v) = 0 \quad \text{if} \quad |q - q'| \geq N_0$$

$$\Delta_q (S_{q'+1} u \Delta_{q'} v) = 0 \quad \text{if} \quad q' \leq q - N_0.$$

Note that u is in the isotropic Sobolev space $H^s(\mathbb{R}^3)$ if and only if

$$\left(\sum_q 2^{2qs} \|\Delta_q u\|_{L^2}^2 \right)^{1/2} < \infty,$$

with equivalence of the norms.

2.2. The anisotropic case. In the frame of anisotropic Lebesgue spaces, the Hölder and Young inequalities reads.

Proposition 2.1. *We have the following inequalities:*

$$\|f g\|_{L_v^r(L_h^p)} \leq \|f\|_{L_v^{r'}(L_h^{p'})} \|g\|_{L_v^{r''}(L_h^{p''})}$$

where $1/r = 1/r' + 1/r''$ and $1/p = 1/p' + 1/p''$.

$$\|f \star g\|_{L_v^r(L_h^p)} \leq \|f\|_{L_v^{r'}(L_h^{p'})} \|g\|_{L_v^{r''}(L_h^{p''})}$$

where $1 + 1/r = 1/r' + 1/r''$ and $1 + 1/p = 1/p' + 1/p''$.

We recall the definition of anisotropic Sobolev spaces and their properties.

Definition 2.2. Let s and s' be two real numbers. The anisotropic Sobolev space $H^{s,s'}(\mathbb{R}^3)$ is the space of tempered distributions u such that $\hat{u}$ belongs to $L_{loc}^1(\mathbb{R}^3)$ and

$$\|u\|_{H^{s,s'}}^2 := \int_{\mathbb{R}^3} (1 + |\xi_h|^2)^s (1 + |\xi_3|^2)^{s'} |\hat{u}(\xi)|^2 d\xi < \infty.$$

It is obvious that the space $H^{s,s'}(\mathbb{R}^3)$ endowed with the norm $\|\cdot\|_{H^{s,s'}}$ is a Hilbert space.

As in the isotropic case, we have the following interpolation property (see [18]).

Proposition 2.2. *Let $s, t, s', t' \in \mathbb{R}$ and $0 \leq \alpha \leq 1$. If u is in $H^{s,s'}(\mathbb{R}^3) \cap H^{t,t'}(\mathbb{R}^3)$, then u belongs to $H^{\alpha s + (1-\alpha)t, \alpha s' + (1-\alpha)t'}(\mathbb{R}^3)$ and*

$$\|u\|_{H^{\alpha s + (1-\alpha)t, \alpha s' + (1-\alpha)t'}} \leq \|u\|_{H^{s,s'}}^\alpha \|u\|_{H^{t,t'}}^{1-\alpha}.$$

The multiplicative properties of the anisotropic Sobolev spaces have been studied by several authors [7, 18, 19, 29]. The following result is proved in [19].

Theorem 2.1. *Let $s, t < 1$, $s + t > 0$, and $s', t' < \frac{1}{2}$, $s' + t' > 0$. There exists a constant $C > 0$ such that, for any $u \in H^{s,s'}(\mathbb{R}^3)$ and $v \in H^{t,t'}(\mathbb{R}^3)$, the product uv belongs to $H^{s+t-1, s'+t'-1/2}(\mathbb{R}^3)$ and*

$$\|uv\|_{H^{s+t-1, s'+t'-1/2}} \leq C \|u\|_{H^{s,s'}} \|v\|_{H^{t,t'}}.$$

This theorem is not sufficient for our purpose since the regularity we need is greater than $1/2$ in the vertical direction. The following theorem, proved in [20], deals with this difficulty.

Theorem 2.2. *Let $s, t < 1$, $s + t > 0$, and $s' > \frac{1}{2}$, $t' \leq s'$, $s' + t' > 0$. If $u \in H^{s,s'}(\mathbb{R}^3)$ and $v \in H^{t,t'}(\mathbb{R}^3)$, then $uv \in H^{s+t-1, t'}(\mathbb{R}^3)$ and there exists a constant $C > 0$ such that, for any $u \in H^{s,s'}(\mathbb{R}^3)$, $v \in H^{t,t'}(\mathbb{R}^3)$, we have*

$$\|uv\|_{H^{s+t-1, t'}(\mathbb{R}^3)} \leq C \|u\|_{H^{s,s'}(\mathbb{R}^3)} \|v\|_{H^{t,t'}(\mathbb{R}^3)}.$$

The proofs of the above theorems and those of some product laws, which will be stated below, essentially use the anisotropic Littlewood-Paley theory. Let us briefly recall this theory (for more details, we refer to [5, 26, 27]).

The basic idea of this theory is to localize in vertical frequencies. Let us introduce the operators of localization in vertical frequencies in the following way:

$$\begin{aligned} \text{if } j \geq 0, \Delta_j^V u &= \mathcal{F}^{-1}(\varphi(2^{-j}|\xi_3|)\mathcal{F}u(\xi)) \\ \Delta_{-1}^V u &= \mathcal{F}^{-1}(\chi(|\xi_3|)\mathcal{F}u(\xi)) \\ \Delta_j^V u &= 0 \quad \text{for } j < -1. \end{aligned}$$

We define also the operator

$$S_q^V u = \sum_{q' \leq q-1} \Delta_{q'}^V u.$$

The interest of this decomposition consists in the fact that any vertical derivative of a function localized in vertical frequencies of size 2^q acts like the multiplication by 2^q . The following lemma, which is often referred to as Bernstein Lemma, will be very useful in what follows.

Lemma 2.4. *Let u be a function such that $\text{supp } \mathcal{F}^v u \subset \mathbb{R}_h^2 \times 2^q \mathcal{C}$, where $\mathcal{C}$ is a dyadic ring. Let $p \geq 1$ and $r \geq r' \geq 1$ be real numbers. Then, there exists a constant $C > 0$ such that*

$$(2.1) \quad 2^{qk} C^{-k} \|u\|_{L_h^p(L_v^r)} \leq \|\partial_{x_3}^k u\|_{L_h^p(L_v^r)} \leq 2^{qk} C^k \|u\|_{L_h^p(L_v^r)}$$

$$(2.2) \quad 2^{qk} C^{-k} \|u\|_{L_v^r(L_h^p)} \leq \|\partial_{x_3}^k u\|_{L_v^r(L_h^p)} \leq 2^{qk} C^k \|u\|_{L_v^r(L_h^p)}$$

$$(2.3) \quad \|u\|_{L_h^p(L_v^r)} \leq C 2^{q(\frac{1}{r'} - \frac{1}{r})} \|u\|_{L_h^p(L_v^{r'})}$$

$$(2.4) \quad \|u\|_{L_v^r(L_h^p)} \leq C 2^{q(\frac{1}{r'} - \frac{1}{r})} \|u\|_{L_v^{r'}(L_h^p)}.$$

We give now the Bony's decomposition in the vertical variable (see [3], [7], [18]). Formally, we can write, for two distributions u and v

$$u = \sum_q \Delta_q^V u \quad ; \quad v = \sum_q \Delta_q^V v \quad \text{and} \quad uv = \sum_{q,q'} \Delta_q^V u \Delta_{q'}^V v.$$

We split this sum into three terms. In the first term, the vertical frequencies of u are smaller than those of v while in the second term we have that the vertical frequencies of v are smaller than those of u . The first two sums are called the para-products. The third term is called the remaining term and is such that the vertical frequencies of u and v are comparable. We shall denote:

$$\begin{aligned} T_u v &= \sum_{q' \leq q-2} \Delta_{q'}^V u \Delta_q^V v = \sum_q S_{q-1}^V u \Delta_q^V v \\ R(u, v) &= \sum_q \sum_{j \in \{0, \pm 1\}} \Delta_q^V u \Delta_{q+j}^V v. \end{aligned}$$

We have the following quasi-orthogonality properties

$$\Delta_q^V (S_{q'-1}^V u \Delta_{q'}^V v) = 0 \quad \text{if} \quad |q - q'| \geq N_0$$

$$\Delta_q^V (S_{q'+1}^V u \Delta_{q'}^V v) = 0 \quad \text{if} \quad q' \leq q - N_0.$$

Note that u is in the anisotropic Sobolev space $H^{0,s}(\mathbb{R}^3)$ if and only if

$$\left(\sum_q 2^{2qs} \|\Delta_q^V u\|_{L^2}^2 \right)^{1/2} < \infty,$$

with equivalence of the norms.

3. PROPAGATION OF REGULARITY FOR THE ANISOTROPIC NAVIER-STOKES SYSTEM

In this section we will prove Theorem 1.3. Let us first remark that this theorem is only a result about the propagation of the isotropic Sobolev regularity of the initial data in the case of anisotropic Navier-Stokes equations. The existence of the solution is known in the larger space $H^{0,s}$ with $s > 1/2$ ([7]) and in the critical Besov space $\mathcal{B}^{0,1/2}$ ([26]). We shall use the energy estimate in H^s to prove that the solution

constructed in [7] preserves the isotropic Sobolev regularity. The main difficulty is the control of the term $\langle (u \cdot \nabla)u, u \rangle_{H^s(\mathbb{R}^3)}$ without using vertical derivatives of u . The following lemma is the key argument in the proof.

Lemma 3.1. *Let $s > 1/2$ be a real number. There exists a positive constant C such that, for any divergence-free vector field $u \in H^s(\mathbb{R}^3)$, we have*

$$\begin{aligned} \left| \langle u \cdot \nabla u, u \rangle_{H^s} \right| &\leq C \left[\|u\|_{L_v^\infty(L_h^2)}^{1/2} \|\nabla_h u\|_{L_v^\infty(L_h^2)}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2} + \right. \\ &\quad \left. \|\nabla_h u\|_{L_v^\infty(L_h^2)} \|u\|_{H^s} \|\nabla_h u\|_{H^s} \right]. \end{aligned}$$

The proof of this lemma will be given in Section 6. Let us go back to the proof of Theorem 1.3.

Proof of Theorem 1.3.

The energy estimate in $H^s(\mathbb{R}^3)$ yields

$$\frac{d}{dt} \|u(t)\|_{H^s}^2 + 2\nu_h \|\nabla_h u(t)\|_{H^s}^2 \leq 2 \left| \langle u \cdot \nabla u, u \rangle_{H^s} \right|.$$

Using Lemma 3.1, we obtain

$$\begin{aligned} \left| \langle u \cdot \nabla u, u \rangle_{H^s} \right| &\leq C \left[\|u\|_{L_v^\infty(L_h^2)}^{1/2} \|\nabla_h u\|_{L_v^\infty(L_h^2)}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2} + \right. \\ &\quad \left. \|\nabla_h u\|_{L_v^\infty(L_h^2)} \|u\|_{H^s} \|\nabla_h u\|_{H^s} \right] \\ &\leq \nu_h/2 \|\nabla_h u\|_{H^s}^2 + C \nu_h^{-3} \left(\nu_h^2 + \|u\|_{L_v^\infty(L_h^2)}^2 \right) \|\nabla_h u\|_{L_v^\infty(L_h^2)}^2 \|u\|_{H^s}^2. \end{aligned}$$

The Gronwall's Lemma gives

$$\|u(t)\|_{H^s}^2 \leq \|u_0\|_{H^s}^2 \exp \left(\int_0^t \left(C \nu_h^{-3} (\nu_h^2 + \|u(\tau)\|_{L_v^\infty(L_h^2)}^2) \|\nabla_h u(\tau)\|_{L_v^\infty(L_h^2)}^2 \right) d\tau \right).$$

This implies that, if

$$\int_0^t \left(C \nu_h^{-3} (\nu_h^2 + \|u(\tau)\|_{L_v^\infty(L_h^2)}^2) \|\nabla_h u(\tau)\|_{L_v^\infty(L_h^2)}^2 \right) d\tau < +\infty,$$

for all $0 \leq t \leq T$, then $T^* \geq T$, where T^* is the lifespan of the solution in H^s .

In particular, if $\|u_0\|_{H^s} \leq c\nu_h$ where c is small enough, then the anisotropic norm of u_0 is small enough ($\|u_0\|_{H^{0,s}} \leq c\nu_h$) and by the results proved in [7], there exists a unique global in time solution in the space $H^{0,s}$. In addition

$$\forall t \geq 0, \quad \|u(t)\|_{H^{0,s}}^2 + \nu_h \int_0^t \|\nabla_h u(\tau)\|_{H^{0,s}}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2.$$

Using the Sobolev embedding $H^{0,s} \hookrightarrow L_v^\infty(L_h^2)$ for $s > 1/2$, we get

$$\forall t \geq 0, \quad \|u(t)\|_{L_v^\infty(L_h^2)}^2 + \nu_h \int_0^t \|\nabla_h u(\tau)\|_{L_v^\infty(L_h^2)}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2.$$

Therefore, the solution exists globally in H^s and it is small compared with the horizontal viscosity. This ends the proof of Theorem 1.3. $\blacksquare$

4. GLOBAL EXISTENCE FOR SMALL INITIAL DATA

In this section, we shall prove the global existence of solutions of (IRF^ε) in $H^{0,s}(\mathbb{R}^3)$ and $H^s(\mathbb{R}^3)$, when the initial data are small enough. It should be noted here that the 2D Navier-Stokes equations are globally well-posed in L^2 , and that the 3D case can be dealt with by splitting the horizontal and vertical variables and using Sobolev embedding $H^{0,s} \hookrightarrow L_v^\infty(L_h^2)$.

The main tool in the proof of Theorem ?? is the following product law (see [7] and [26] for the critical case).

Lemma 4.1. *Let $s > 1/2$ be a real number. There exists a positive constant C_s such that, for any $u, v \in H^{0,s}(\mathbb{R}^3)$, u being divergence-free, we have*

$$\begin{aligned} \left| \langle u, \nabla v, v \rangle_{H^{0,s}} \right| &\leq C_s \left(\|u\|_{H^{0,s}}^{1/2} \|\nabla_h u\|_{H^{0,s}}^{1/2} \|v\|_{H^{0,s}}^{1/2} \|\nabla_h v\|_{H^{0,s}}^{3/2} \right. \\ &\quad \left. + \|v\|_{H^{0,s}} \|\nabla_h v\|_{H^{0,s}} \|\nabla_h u\|_{H^{0,s}} \right). \end{aligned}$$

In particular

$$\left| \langle u, \nabla u, u \rangle_{H^{0,s}} \right| \leq C_s \|u\|_{H^{0,s}} \|\nabla_h u\|_{H^{0,s}}^2.$$

Note that, in such inequalities, the following simple fact is fundamental

$$\operatorname{div} u = 0 \implies \partial_3 u_3 = -\operatorname{div}_h u_h.$$

Proof of Theorem 1.1.

Without loss of generality, one can assume that $\nu_v = 0$. For simplicity, we omit the dependance on ε in u^ε . Therefore, u satisfies

$$(4.5) \quad \partial_t u + (u, \nabla)u - \nu_h \Delta_h u + \frac{1}{\varepsilon} (u \times B(t, x_h)) = -\nabla p.$$

Taking the scalar product of (4.5) with u in $H^{0,s}$, and using the fact that

$$\langle u \times B(t, x_h), u \rangle_{H^{0,s}} = 0,$$

we infer

$$(4.6) \quad \frac{d}{dt} \|u(t)\|_{H^{0,s}}^2 + 2\nu_h \|\nabla_h u(t)\|_{H^{0,s}}^2 \leq 2 \left| \langle (u, \nabla)u, u \rangle_{H^{0,s}} \right|.$$

By Lemma 4.1, (4.6) becomes

$$(4.7) \quad \frac{d}{dt} \|u(t)\|_{H^{0,s}}^2 + 2\nu_h \|\nabla_h u(t)\|_{H^{0,s}}^2 \leq 2C_s \|u\|_{H^{0,s}} \|\nabla_h u\|_{H^{0,s}}^2.$$

Define T^* by

$$T^* = \sup \left\{ T > 0 / \forall 0 \leq t \leq T, \quad \|u(t)\|_{H^{0,s}} \leq 2c\nu_h < \frac{\nu_h}{2C_s} \right\}.$$

Using (4.7), we get

$$\forall 0 \leq t < T^*, \quad \|u(t)\|_{H^{0,s}}^2 + \nu_h \int_0^t \|\nabla_h u(\tau)\|_{H^{0,s}}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2 \leq (c\nu_h)^2.$$

Thus

$$\forall 0 \leq t < T^*, \quad \|u(t)\|_{H^{0,s}} \leq c\nu_h < 2c\nu_h,$$

and so

$$T^* = +\infty.$$

Moreover, we have the following energy estimate

$$\forall t \geq 0, \quad \|u(t)\|_{H^{0,s}}^2 + \nu_h \int_0^t \|\nabla_h u(\tau)\|_{H^{0,s}}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2.$$

Theorem 1.1 is then completely proved. $\blacksquare$

We now come to the proof of Theorem 1.4 about global existence for small initial data in the isotropic Sobolev space H^s . Here, the product law stated in Lemma 3.1 play a crucial role.

Proof of Theorem 1.4.

The energy estimate in $H^s(\mathbb{R}^3)$ implies

$$\frac{d}{dt} \|u(t)\|_{H^s}^2 + 2\nu_h \|\nabla_h u(t)\|_{H^s}^2 \leq 2 \left| \langle (u \cdot \nabla) u, u \rangle_{H^s} \right| + \frac{2}{\varepsilon} \left| \langle u \times B, u \rangle_{H^s} \right|.$$

The assumption on B yields

$$\left| \langle u \times B, u \rangle_{H^s} \right| \leq C \|u\|_{H^s}^2.$$

Using Lemma 3.1 and the injection $H^{0,s} \hookrightarrow L_v^\infty(L_h^2)$, we infer

$$\begin{aligned} \left| \langle (u \cdot \nabla) u, u \rangle_{H^s} \right| &\leq C \left[\|u\|_{H^{0,s}}^{1/2} \|\nabla_h u\|_{H^{0,s}}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2} + \right. \\ &\quad \left. \|\nabla_h u\|_{H^{0,s}} \|u\|_{H^s} \|\nabla_h u\|_{H^s} \right] \\ &\leq \nu_h/2 \|\nabla_h u\|_{H^s}^2 + C \nu_h^{-3} \left(\nu_h^2 + \|u\|_{H^{0,s}}^2 \right) \|\nabla_h u\|_{H^{0,s}}^2 \|u\|_{H^s}^2. \end{aligned}$$

The Gronwall's Lemma leads to

$$\|u(t)\|_{H^s}^2 \leq \|u_0\|_{H^s}^2 \exp \left(\int_0^t (C/\varepsilon + C\nu_h^{-3}(\nu_h^2 + \|u(\tau)\|_{H^{0,s}}^2) \|\nabla_h u(\tau)\|_{H^{0,s}}^2) d\tau \right).$$

The fact that u_0 is small in $H^{0,s}$ together with Theorem 1.1 implies that u is global in time. Moreover

$$\|u(t)\|_{H^{0,s}}^2 + \nu_h \int_0^t \|\nabla_h u(\tau)\|_{H^{0,s}}^2 d\tau \leq \|u_0\|_{H^{0,s}}^2, \quad \text{for any } t \geq 0.$$

It follows that

$$\|u(t)\|_{H^s}^2 \leq \|u_0\|_{H^s}^2 \exp \left(C\nu_h^{-3}(\nu_h^2 + \|u_0\|_{H^{0,s}}^2) \|u_0\|_{H^{0,s}}^2 \right) \exp \left(C\frac{t}{\varepsilon} \right).$$

This completes the proof of Theorem 1.4. $\blacksquare$

5. UNIFORM LOCAL EXISTENCE

In this section we wish to investigate the uniform local existence in both anisotropic and isotropic cases. We prove Theorem 1.2 and Theorem 1.5 stated in the introduction. As remarked before, we shall assume that B only depends on one space variable since we are unable to recover similar results in general case. Before we come to the details of the proofs, let us first explain rapidly the scheme and make some clarifying comments.

We split the initial data u_0 in a small part in $H^{0,s}$ and a smooth one. First, we solve the linear system with smooth initial data to obtain a global and bounded

solution v^ε . Then, we consider the perturbed system satisfied by $w^\varepsilon := u^\varepsilon - v^\varepsilon$ and with small initial data. We have to prove that w^ε exists on a uniform time interval. The strategy here is to use energy estimate in $H^{0,s}$ and a Gronwall's lemma in order to prove that w^ε remains small on a uniform time interval. The main difficulty comes from the term

$$\langle (v^\varepsilon \cdot \nabla) v^\varepsilon, w^\varepsilon \rangle_{H^{0,s}},$$

but using the fact that two frequency directions of v^ε are bounded, one can prove

$$\left| \langle (v^\varepsilon \cdot \nabla) v^\varepsilon, w^\varepsilon \rangle_{H^{0,s}} \right| \leq C \|v^\varepsilon\|_{L^2}^3 \|\nabla_h v^\varepsilon\|_{L^2} + \frac{\nu_h}{10} \|\nabla_h w^\varepsilon\|_{H^{0,s}}^2.$$

This inequality, together with the fact that

$$\int_0^t \|v^\varepsilon(\tau)\|_{L^2}^3 \|\nabla_h v^\varepsilon(\tau)\|_{L^2} d\tau \lesssim t^{1/2} \|u_0\|_{L^2}^4,$$

allows us to carry out the proofs.

We now come to the details.

Proof of Theorem 1.2.

As mentioned before, the main argument consists in splitting the initial data in a small part in $H^{0,s}$ and a regular one. To do this, we set $S_N u = \mathcal{F}^{-1}(\chi(2^{-N}|\xi|)\mathcal{F}u)$ and we take N sufficiently large (depending on u_0 and ν_h) such that $\|(I - S_N)u_0\|_{H^{0,s}} \leq c\nu_h$, where $c > 0$ is small enough. Then, $u_0 = S_N u_0 + (I - S_N)u_0$, with $S_N u_0 \in H^\infty(\mathbb{R}^3)$. We point out that throughout the rest of this section, C will denotes a positive constant which may depends on N , ν_h , s but not on ε .

First, we consider the following linear system:

$$(5.8) \quad \begin{cases} \partial_t v_N^\varepsilon - \nu_h \Delta_h v_N^\varepsilon + \frac{1}{\varepsilon} (v_N^\varepsilon \times B(t, x_1)) = -\nabla p_N^\varepsilon \\ \operatorname{div} v_N^\varepsilon = 0 \\ v_N^\varepsilon|_{t=0} = S_N u_0. \end{cases}$$

Clearly (5.8) has a unique global solution

$$v_N^\varepsilon \in C(\mathbb{R}_+; H^{0,s}) \quad \text{with} \quad \nabla_h v_N^\varepsilon \in L^2(\mathbb{R}_+; H^{0,s}).$$

Since B only depends on t and x_1 , we obtain $S_N^{x_2, x_3}(u \times B(t, x_1)) = S_N^{x_2, x_3} u \times B(t, x_1)$, where $S_N^{x_2, x_3}$ is the operator of localization in ξ_2 and ξ_3 direction defined by $S_N^{x_2, x_3} u = \mathcal{F}^{-1}(\tilde{\chi}(2^{-N}|(\xi_2, \xi_3)|)\mathcal{F}u(\xi))$, $\tilde{\chi}$ being a smooth compactly supported function whose value is 1 on the support of χ . By uniqueness and the fact that $S_N^{x_2, x_3} S_N u_0 = S_N u_0$, we get $v_N^\varepsilon = S_N^{x_2, x_3} v_N^\varepsilon$. This implies the important fact that v_N^ε is a regular function with respect to the x_2 and x_3 variables.

Next, we consider the perturbed system:

$$(5.9) \quad \begin{cases} \partial_t w_N^\varepsilon + (w_N^\varepsilon + v_N^\varepsilon) \nabla (w_N^\varepsilon + v_N^\varepsilon) - \nu_h \Delta_h w_N^\varepsilon + \frac{1}{\varepsilon} (w_N^\varepsilon \times B(t, x_1)) = -\nabla q_N^\varepsilon \\ \operatorname{div} w_N^\varepsilon = 0 \\ w_N^\varepsilon|_{t=0} = (I - S_N)u_0. \end{cases}$$

We shall now be interested in proving that w_N^ε exists on a uniform time interval. The energy estimate in $H^{0,s}$ yields

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \|w_N^\varepsilon(t)\|_{H^{0,s}}^2 + \nu_h \|\nabla_h w_N^\varepsilon(t)\|_{H^{0,s}}^2 &\leq |\langle w_N^\varepsilon \nabla w_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}| \\ &\quad + |\langle v_N^\varepsilon \nabla w_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}| + |\langle w_N^\varepsilon \nabla v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}| \\ &\quad + |\langle v_N^\varepsilon \nabla v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}| \end{aligned}$$

For the first two terms in the right hand side, we apply Lemma 4.1 to obtain

$$\left| \langle w_N^\varepsilon \nabla w_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} \right| \leq C_s \|w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^2,$$

and

$$\begin{aligned} \left| \langle v_N^\varepsilon \nabla w_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq C_s \|v_N^\varepsilon\|_{H^{0,s}}^{1/2} \|\nabla_h v_N^\varepsilon\|_{H^{0,s}}^{1/2} \|w_N^\varepsilon\|_{H^{0,s}}^{1/2} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^{3/2} \\ &\quad + \|w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h v_N^\varepsilon\|_{H^{0,s}} \\ &\leq C_s \nu_h^{-3} (\nu_h^2 + \|v_N^\varepsilon\|_{H^{0,s}}^2) \|\nabla_h v_N^\varepsilon\|_{H^{0,s}}^2 \|w_N^\varepsilon\|_{H^{0,s}}^2 + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^2. \end{aligned}$$

For the third term, we write

$$\langle w_N^\varepsilon \nabla v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} = \langle w_{N,h}^\varepsilon \nabla_h v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} + \langle w_{N,3}^\varepsilon \partial_3 v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}.$$

The anisotropic product law given in Theorem 2.2 implies

$$\begin{aligned} \left| \langle w_{N,h}^\varepsilon \nabla_h v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq C_s \|\nabla_h v_N^\varepsilon\|_{H^{0,s}} \|w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\ &\leq C_s \nu_h^{-1} \|\nabla_h v_N^\varepsilon\|_{H^{0,s}}^2 \|w_N^\varepsilon\|_{H^{0,s}}^2 + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^2. \end{aligned}$$

We also have

$$\left| \langle w_{N,3}^\varepsilon \partial_3 v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} \right| \leq C_s \|\partial_3 v_N^\varepsilon\|_{H^{0,s}} \|w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}.$$

Since v_N^ε is localized in the ξ_3 direction, we can apply Lemma 2.4 to obtain

$$\|\partial_3 v_N^\varepsilon\|_{H^{0,s}} \leq C 2^N \|v_N^\varepsilon\|_{H^{0,s}}.$$

Finally

$$\begin{aligned} \left| \langle w_{N,3}^\varepsilon \partial_3 v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq C_s 2^N \|v_N^\varepsilon\|_{H^{0,s}} \|w_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\ &\leq C_s 2^{2N} \nu_h^{-1} \|v_N^\varepsilon\|_{H^{0,s}}^2 \|w_N^\varepsilon\|_{H^{0,s}}^2 + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^2. \end{aligned}$$

What remains to estimate, therefore, is the term $\langle v_N^\varepsilon \nabla v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}}$. Note that (and this will be clear in the rest of the proof) this term is the only one for which we need that B only depends on t and x_1 .

Since the vector field v_N^ε is divergence-free, we can write

$$\langle v_N^\varepsilon \nabla v_N^\varepsilon, w_N^\varepsilon \rangle_{H^{0,s}} = (\operatorname{div} \langle v_N^\varepsilon \otimes v_N^\varepsilon \rangle, w_N^\varepsilon)_{H^{0,s}} = \langle v_N^\varepsilon \otimes v_N^\varepsilon, \nabla_h w_N^\varepsilon \rangle_{H^{0,s}} + \langle \partial_3 (v_N^\varepsilon \otimes v_N^\varepsilon), w_N^\varepsilon \rangle_{H^{0,s}}.$$

We have the estimate

$$\begin{aligned}
\left| \langle v_N^\varepsilon \otimes v_N^\varepsilon, \nabla_h w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq \|v_N^\varepsilon \otimes v_N^\varepsilon\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\
&\leq C 2^{2Ns} \|v_N^\varepsilon \otimes v_N^\varepsilon\|_{L^2} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\
&\leq C 2^{2Ns} \|v_N^\varepsilon\|_{L_{x_1}^4(L_{x_2,x_3}^\infty)} \|v_N^\varepsilon\|_{L_{x_1}^4(L_{x_2,x_3}^2)} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\
&\leq C 2^{(2s+1)N} \|v_N^\varepsilon\|_{L_{x_1}^4(L_{x_2,x_3}^2)}^2 \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}.
\end{aligned}$$

By the Gagliardo-Nirenberg inequality, we get

$$\|v_N^\varepsilon\|_{L_{x_1}^4(L_{x_2,x_3}^2)} \leq C \|v_N^\varepsilon\|_{L_{x_2,x_3}^2(L_{x_1}^4)} \leq C \|v_N^\varepsilon\|_{L^2}^{3/4} \|\partial_{x_1} v_N^\varepsilon\|_{L^2}^{1/4}.$$

Hence

$$\begin{aligned}
\left| \langle v_N^\varepsilon \otimes v_N^\varepsilon, \nabla_h w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq C 2^{N(2s+1)} \|v_N^\varepsilon\|_{L^2}^{3/2} \|\nabla_h v_N^\varepsilon\|_{L^2}^{1/2} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}} \\
&\leq C \nu_h^{-1} \|v_N^\varepsilon\|_{L^2}^3 \|\nabla_h v_N^\varepsilon\|_{L^2} + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon\|_{H^{0,s}}^2.
\end{aligned}$$

Similarly, one has

$$\begin{aligned}
\left| \langle \partial_3(v_N^\varepsilon \otimes v_N^\varepsilon), w_N^\varepsilon \rangle_{H^{0,s}} \right| &\leq C 2^{2N} 2^{2Ns} \|v_N^\varepsilon \otimes v_N^\varepsilon\|_{L^2} \|w_N^\varepsilon\|_{H^{0,s}} \\
&\leq C \nu_h^{-1} \|v_N^\varepsilon\|_{L^2}^3 \|\nabla_h v_N^\varepsilon\|_{L^2} + \frac{\nu_h}{10} \|w_N^\varepsilon\|_{H^{0,s}}^2.
\end{aligned}$$

To summarize, we combine above estimates to obtain

$$\begin{aligned}
\frac{d}{dt} \|w_N^\varepsilon(t)\|_{H^{0,s}}^2 + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon(t)\|_{H^{0,s}}^2 &\leq \|w_N^\varepsilon(t)\|_{H^{0,s}} \|\nabla_h w_N^\varepsilon(t)\|_{H^{0,s}}^2 \\
&\quad + C \|v_N^\varepsilon(t)\|_{L^2}^3 \|\nabla_h v_N^\varepsilon(t)\|_{L^2} \\
&\quad + C (1 + \|v_N^\varepsilon(t)\|_{H^{0,s}}^2) \|w_N^\varepsilon(t)\|_{H^{0,s}}^2 \\
&\quad + C (1 + \|v_N^\varepsilon(t)\|_{H^{0,s}}^2) \|\nabla_h v_N^\varepsilon(t)\|_{H^{0,s}}^2 \|w_N^\varepsilon(t)\|_{H^{0,s}}^2.
\end{aligned}$$

Since $w_N^\varepsilon(0)$ is small in $H^{0,s}$, we can define the time $T_{\varepsilon,N} > 0$ by

$$T_{\varepsilon,N} = \sup \left\{ t > 0; \quad \forall 0 \leq t' \leq t, \quad \|w_N^\varepsilon(t')\|_{H^{0,s}} \leq 2c\nu_h \right\}$$

On the time interval $[0, T_{\varepsilon,N}]$, we have

$$\begin{aligned}
\frac{d}{dt} \|w_N^\varepsilon(t)\|_{H^{0,s}}^2 + \frac{\nu_h}{10} \|\nabla_h w_N^\varepsilon(t)\|_{H^{0,s}}^2 &\leq C \|v_N^\varepsilon(t)\|_{L^2}^3 \|\nabla_h v_N^\varepsilon(t)\|_{L^2} \\
&\quad + C (1 + \|v_N^\varepsilon(t)\|_{H^{0,s}}^2 + (1 + \|v_N^\varepsilon(t)\|_{H^{0,s}}^2) \|\nabla_h v_N^\varepsilon(t)\|_{H^{0,s}}^2) \|w_N^\varepsilon(t)\|_{H^{0,s}}^2.
\end{aligned}$$

Using Gronwall's Lemma, energy estimate and the fact that

$$\int_0^t \|\nabla_h v_N^\varepsilon(\tau)\|_{L^2} d\tau \leq t^{1/2} \left(\int_0^t \|\nabla_h v_N^\varepsilon\|_{L^2}^2 d\tau \right)^{1/2} \leq \left(\frac{t}{2\nu_h} \right)^{1/2} \|u_0\|_{L^2},$$

we infer

$$\|w_N^\varepsilon(t)\|_{H^{0,s}}^2 \leq ((c\nu_h)^2 + t^{\frac{1}{2}} C \|u_0\|_{L^2}^4) \exp \left(t C (1 + \|u_0\|_{H^{0,s}}^2 + (1 + \|u_0\|_{H^{0,s}}^2) \|u_0\|_{L^2}^2) \right).$$

It follows that $T_{\varepsilon,N} \geq T$ where $T > 0$ is given by

$$((c\nu_h)^2 + T^{\frac{1}{2}}C\|u_0\|_{L^2}^4) \exp\left(T C(\|u_0\|_{H^{0,s}}^2 + (1 + \|u_0\|_{H^{0,s}}^2)\|u_0\|_{L^2}^2)\right) \leq \left(\frac{3}{2}c\nu_h\right)^2.$$

Thus we have proved that w_N^ε exists on a uniform time interval and the conclusion follows. This being said we have only to add the remark that the time T depends on the distribution of the frequencies of the initial data and not only on the size of the data. $\blacksquare$

Proof of Theorem 1.5.

Let us now take $u_0 \in H^s$ with $s > 1/2$. By Theorem 1.2, there exists a positive time T independent of $\varepsilon > 0$ and a unique solution $u^\varepsilon \in C([0, T], H^{0,s})$ of the system (IRF^ε) , with $\nabla_h u^\varepsilon \in L^2([0, T], H^{0,s})$. Since $H^{0,s}$ is continuously embedded in $L_v^\infty(L_h^2)$, we deduce that the norms $\|u^\varepsilon(t)\|_{L_v^\infty(L_h^2)}$ and $\int_0^t \|\nabla_h u^\varepsilon(\tau)\|_{L_v^\infty(L_h^2)}^2 d\tau$ are bounded on the time interval $[0, T]$. By Theorem 1.3, we obtain that the lifespan T^ε of the solution u^ε in the space H^s satisfies the lower bound $T^\varepsilon > T$. This means that the solution exists on a uniform time interval in the $H^{0,s}$ space as well as in the H^s space. $\blacksquare$

6. PROOF OF LEMMA 3.1

We begin with two key estimates based on the divergence-free condition.

Proposition 6.1. *There exists a positive constant C , such that for every divergence-free vector field $u = (u_1, u_2, u_3)$,*

$$(6.10) \quad \|\nabla u_3\|_{H^s(\mathbb{R}^3)} \leq C \|\nabla_h u\|_{H^s(\mathbb{R}^3)}$$

$$(6.11) \quad \|\Delta_q u\|_{L_v^2 L_h^4} \leq 2^{-qs} c_q \|u\|_{H^s(\mathbb{R}^3)}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{1/2}.$$

Hereafter, (b_q) and (c_q) stands for generic positive sequences (which could depend on t) such that

$$\sum_q b_q \leq 1 \quad \text{and} \quad \sum_q c_q^2 \leq 1.$$

Proof of Proposition 6.1.

The divergence-free condition implies that

$$\nabla u_3 = (\nabla_h u_3, -\operatorname{div}_h u^h),$$

from which the estimate (6.10) directly follows.

To prove (??), we write

$$\begin{aligned} \|\Delta_q u\|_{L_v^2 L_h^4} &\leq \|\Delta_q u\|_{L^2(\mathbb{R}^3)}^{1/2} \|\Delta_q \nabla_h u\|_{L^2(\mathbb{R}^3)}^{1/2} \\ &\leq \left(2^{-\frac{qs}{2}} c_q^{1/2} \|u\|_{H^s(\mathbb{R}^3)}^{1/2}\right) \cdot \left(2^{-\frac{qs}{2}} c_q^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{1/2}\right) \\ &\leq 2^{-qs} c_q \|u\|_{H^s(\mathbb{R}^3)}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{1/2}. \end{aligned}$$

$\blacksquare$

Now, we return to the proof of Lemma 3.1. Using the fact that

$$\langle f, g \rangle_{H^s(\mathbb{R}^3)} \approx \sum_{q \geq -1} 2^{2qs} (\Delta_q f, \Delta_q g)_{L^2(\mathbb{R}^3)},$$

we only need to prove that

$$\begin{aligned} \left| (\Delta_q(u \cdot \nabla u), \Delta_q u)_{L^2(\mathbb{R}^3)} \right| &\leq C 2^{-2qs} c_q \left(\|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2} + \right. \\ &\quad \left. \|\nabla_h u\|_{L_v^\infty L_h^2} \|u\|_{H^s} \|\nabla_h u\|_{H^s} \right). \end{aligned}$$

We shall split the term $(\Delta_q(u \cdot \nabla u), \Delta_q u)_{L^2}$ in the following way

$$\int_{\mathbb{R}^3} \Delta_q(u \cdot \nabla u) \Delta_q u \, dx = \mathcal{I}_q^h + \mathcal{I}_q^v$$

where

$$\begin{aligned} \mathcal{I}_q^h &= \int_{\mathbb{R}^3} \Delta_q(u_h \cdot \nabla_h u) \Delta_q u \, dx \\ \mathcal{I}_q^v &= \int_{\mathbb{R}^3} \Delta_q(u_3 \partial_3 u) \Delta_q u \, dx. \end{aligned}$$

Let us start with the study of the horizontal terms. Using the para-differential decomposition of Bony, we can write

$$\mathcal{I}_q^h = \mathcal{I}_1^{h,q} + \mathcal{I}_2^{h,q} + \mathcal{R}^{h,q},$$

where

$$\begin{aligned} \mathcal{I}_1^{h,q} &= \sum_{|q'-q| < N_0} \int_{\mathbb{R}^3} \Delta_q(S_{q'-1} u_h \cdot \nabla_h \Delta_{q'} u) \Delta_q u \, dx \\ \mathcal{I}_2^{h,q} &= \sum_{|q'-q| < N_0} \int_{\mathbb{R}^3} \Delta_q(\Delta_{q'} u_h \nabla_h S_{q'-1} u) \Delta_q u \, dx \\ \mathcal{R}^{h,q} &= \sum_{\substack{q' > q - N_0 \\ i \in \{0, \pm 1\}}} \int_{\mathbb{R}^3} \Delta_q(\Delta_{q'} u_h \cdot \nabla_h \Delta_{q'+i} u) \Delta_q u \, dx. \end{aligned}$$

• **Estimate of $\mathcal{I}_1^{h,q}$**

By the Hölder inequality, we infer

$$|\mathcal{I}_1^{h,q}| \leq \sum_{|q'-q| < N_0} \|\Delta_q(S_{q'-1} u_h \cdot \nabla_h \Delta_{q'} u)\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4}.$$

Proposition 6.1 gives

$$\|\Delta_q u\|_{L_v^2 L_h^4} \leq 2^{-qs} c_q \|u\|_{H^s(\mathbb{R}^3)}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{1/2}.$$

Using Lemma 2.1 and Hölder inequality, we get

$$\begin{aligned}
\|\Delta_q(S_{q'-1}u_h \cdot \nabla_h \Delta_{q'}u)\|_{L_v^2 L_h^{4/3}} &\leq C \|S_{q'-1}u_h \cdot \nabla_h \Delta_{q'}u\|_{L_v^2 L_h^{4/3}} \\
&\leq C \|S_{q'-1}u_h\|_{L_v^\infty L_h^4} \|\nabla_h \Delta_{q'}u\|_{L_v^2 L_h^2} \\
&\leq C 2^{-q's} c_{q'} \|u_h\|_{L_v^\infty L_h^4} \|\nabla_h u\|_{H^s(\mathbb{R}^3)} \\
&\leq C 2^{-q's} c_{q'} \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}.
\end{aligned}$$

Finally

$$|\mathcal{I}_1^{h,q}| \leq 2^{-2qs} b_q \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|u\|_{H^s(\mathbb{R}^3)}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{3/2}.$$

• **Estimate of $\mathcal{I}_2^{h,q}$**

Arguing as in the estimate of the term $\mathcal{I}_1^{h,q}$, we get

$$\begin{aligned}
|\mathcal{I}_2^{h,q}| &\leq \sum_{|q-q'| < N_0} \|\Delta_q(\Delta_{q'}u_h \cdot \nabla_h S_{q'-1}u)\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4} \\
&\leq C \sum_{|q-q'| < N_0} \|\Delta_{q'}u\|_{L_v^2 L_h^4} \|\nabla_h S_{q'-1}u\|_{L_v^\infty L_h^2} \|\Delta_q u\|_{L_v^2 L_h^4} \\
&\leq 2^{-2qs} b_q \|\nabla_h u\|_{L_v^\infty L_h^2} \|u\|_{H^s} \|\nabla_h u\|_{H^s}.
\end{aligned}$$

• **Estimate of $\mathcal{R}^{h,q}$**

Using the Hölder inequality, we get

$$|\mathcal{R}^{h,q}| \leq \|\Delta_q u\|_{L_v^2 L_h^4} \sum_{\substack{q' \geq q-4 \\ i \in \{0, \pm 1\}}} \|\Delta_q(\Delta_{q'}u_h \cdot \nabla_h \Delta_{q'+i}u)\|_{L_v^2 L_h^{4/3}}$$

Proposition 6.1 implies that

$$\|\Delta_q u\|_{L_v^2 L_h^4} \leq 2^{-qs} c_q \|u\|_{H^s(\mathbb{R}^3)}^{1/2} \|\nabla_h u\|_{H^s(\mathbb{R}^3)}^{1/2}.$$

Moreover, we have

$$\begin{aligned}
\|\Delta_q(\Delta_{q'}u_h \cdot \nabla_h \Delta_{q'+i}u)\|_{L_v^2 L_h^{4/3}} &\leq C \|\Delta_{q'}u_h \cdot \nabla_h \Delta_{q'+i}u\|_{L_v^2 L_h^{4/3}} \\
&\leq C \|\Delta_{q'}u_h\|_{L_v^\infty L_h^4} \|\nabla_h \Delta_{q'+i}u\|_{L^2(\mathbb{R}^3)} \\
&\leq 2^{-q's} c_{q'} \|\nabla_h u\|_{H^s(\mathbb{R}^3)} \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2}.
\end{aligned}$$

Finally, we obtain

$$|\mathcal{R}^{h,q}| \leq 2^{-2qs} b_q \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2}.$$

• **Estimate of $\mathcal{I}_q^v$**

The vertical term is more delicate since the vertical viscosity vanishes, and hence we lose the regularity in the vertical direction. To avoid this difficulty, we proceed in the following way. We write the Bony's decomposition for $\Delta_q(u_3 \partial_3 u)$ in two para-product terms and in the rest term. Using some commutators, we decompose now the para-product term $\Delta_q T_{u_3} \partial_3 u$ as following

$$\Delta_q(S_{q'-1}u_3 \partial_3 \Delta_{q'}u) = S_{q'-1}u_3 \partial_3 \Delta_q \Delta_{q'}u + (S_{q'-1}u_3 - S_{q-1}u_3) \partial_3 \Delta_q \Delta_{q'}u + [\Delta_q, S_{q'-1}u_3] \partial_3 \Delta_{q'}u.$$

Summing in q' , we obtain finally the following decomposition

$$\mathcal{I}_q^v = \mathcal{I}_1^{v,q} + \mathcal{I}_2^{v,q} + \mathcal{I}_3^{v,q} + \mathcal{I}_4^{v,q} + \mathcal{R}^{v,q},$$

where

$$\begin{aligned} \mathcal{I}_1^{v,q} &= \int_{\mathbb{R}^3} (S_{q-1}u_3) \partial_3 \Delta_q u \cdot \Delta_q u \, dx \\ \mathcal{I}_2^{v,q} &= \sum_{|q'-q| < N_0} \int_{\mathbb{R}^3} [\Delta_q, S_{q'-1}u_3] \partial_3 \Delta_{q'} u \cdot \Delta_q u \, dx \\ \mathcal{I}_3^{v,q} &= \sum_{|q'-q| < N_0} \int_{\mathbb{R}^3} (S_{q'-1}u_3 - S_{q-1}u_3) \partial_3 \Delta_q \Delta_{q'} u \cdot \Delta_q u \, dx \\ \mathcal{I}_4^{v,q} &= \sum_{|q'-q| < N_0} \int_{\mathbb{R}^3} \Delta_q (\Delta_{q'} u_3 \partial_3 S_{q'-1}u) \cdot \Delta_q u \, dx \\ \mathcal{R}^{v,q} &= \sum_{\substack{q' > q - N_0 \\ |q'' - q'| \leq 1}} \int_{\mathbb{R}^3} \Delta_q (\Delta_{q'} u_3 \partial_3 \Delta_{q''} u) \cdot \Delta_q u \, dx. \end{aligned}$$

We shall now estimate each of the above terms.

• **Estimate of $\mathcal{I}_1^{v,q}$**

Integrating by parts yields

$$\mathcal{I}_1^{v,q} = -\frac{1}{2} \int_{\mathbb{R}^3} (S_{q-1} \partial_3 u_3) \Delta_q u \cdot \Delta_q u \, dx.$$

Using Proposition 6.1, we get

$$\begin{aligned} |\mathcal{I}_1^{v,q}| &\leq C \|\nabla_h u\|_{L_v^\infty L_h^2} \|\Delta_q u\|_{L_v^2 L_h^4}^2 \\ &\leq 2^{-2qs} b_q \|\nabla_h u\|_{L_v^\infty L_h^2} \|u\|_{H^s} \|\nabla_h u\|_{H^s}. \end{aligned}$$

• **Estimate of $\mathcal{I}_2^{v,q}$**

By Hölder inequality, we have

$$|\mathcal{I}_2^{v,q}| \leq \|[\Delta_q, S_{q'-1}u_3] \partial_3 \Delta_{q'} u\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4}.$$

Using Lemma 2.2, Proposition 6.1 and the fact that $\Delta_{q'} u$ is localized in vertical frequencies, we infer

$$\begin{aligned} |\mathcal{I}_2^{v,q}| &\leq C 2^{-q} \|S_{q'-1} \nabla u_3\|_{L_v^\infty L_h^2} \|\partial_3 \Delta_{q'} u\|_{L_v^2 L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C 2^{q'-q} \|(\nabla_h u_3, \partial_3 u_3)\|_{L_v^\infty L_h^2} \|\Delta_{q'} u\|_{L_v^2 L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C \|\nabla_h u\|_{L_v^\infty L_h^2} \|\Delta_{q'} u\|_{L_v^2 L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C \|\nabla_h u\|_{L_v^\infty L_h^2} \|\Delta_{q'} u\|_{L^2}^{1/2} \|\Delta_{q'} \nabla_h u\|_{L^2}^{1/2} \|\Delta_q u\|_{L^2}^{1/2} \|\Delta_q \nabla_h u\|_{L^2}^{1/2} \\ &\leq C 2^{-2qs} b_q \|\nabla_h u\|_{L_v^\infty L_h^2} \|u\|_{H^s} \|\nabla_h u\|_{H^s}. \end{aligned}$$

• **Estimate of $\mathcal{I}_3^{v,q}$**

Since $S_{q'-1}u_3 - S_{q-1}u_3$ is localized in frequency in a ring of size 2^q , we get

$$\begin{aligned} |\mathcal{I}_3^{v,q}| &\leq \sum_{q' \sim q} \|S_{q'-1}u_3 - S_{q-1}u_3\|_{L_v^\infty L_h^2} \|\partial_3 \Delta_q \Delta_{q'} u\|_{L_v^2 L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq \sum_{q' \sim q} 2^{-q} \|(S_{q'-1} - S_{q-1}) \nabla u_3\|_{L_v^\infty L_h^2} \|\partial_3 \Delta_q \Delta_{q'} u\|_{L_v^2 L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4} \end{aligned}$$

Using Proposition 6.1, we obtain

$$|\mathcal{I}_3^{v,q}| \leq C 2^{-2qs} b_q \|\nabla_h u\|_{L_v^\infty L_h^2} \|u\|_{H^s} \|\nabla_h u\|_{H^s}.$$

• **Estimate of $\mathcal{I}_4^{v,q}$**

As in the above estimates, we have

$$\begin{aligned} |\mathcal{I}_4^{v,q}| &\leq C \sum_{|q-q'| < N_0} \|\Delta_q (\Delta_{q'} u_3 \partial_3 S_{q'-1} u)\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C \sum_{|q-q'| < N_0} \|\Delta_{q'} u_3 \partial_3 S_{q'-1} u\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C \sum_{|q-q'| < N_0} \|\Delta_{q'} u_3\|_{L_v^2 L_h^2} \|\partial_3 S_{q'-1} u\|_{L_v^\infty L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4}. \end{aligned}$$

Proposition 6.1 implies that

$$\begin{aligned} \|\Delta_{q'} u_3\|_{L^2} &\leq C 2^{-q'} \|\Delta_{q'} \nabla u_3\|_{L^2} \\ &\leq C 2^{-q} 2^{-q's} c_{q'} \|\nabla_h u\|_{H^s}, \end{aligned}$$

and

$$\|\Delta_q u\|_{L_v^2 L_h^4} \leq 2^{-qs} c_q \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{1/2}.$$

In addition

$$\begin{aligned} \|\partial_3 S_{q'-1} u\|_{L_v^\infty L_h^4} &\leq C 2^{q'} \|u\|_{L_v^\infty L_h^4} \\ &\leq C 2^{q'} \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2}. \end{aligned}$$

Hence

$$|\mathcal{I}_4^{v,q}| \leq 2^{-2qs} b_q \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2}.$$

• **Estimate of $\mathcal{R}^{v,q}$**

We easily see that

$$\begin{aligned} |\mathcal{R}^{v,q}| &\leq C \sum_{q' > q - N_0} \|\Delta_q (\Delta_{q'} u_3 \partial_3 \Delta_{q''} u)\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq C \sum_{q' > q - N_0} \|\Delta_{q'} u_3 \partial_3 \Delta_{q''} u\|_{L_v^2 L_h^{4/3}} \|\Delta_q u\|_{L_v^2 L_h^4} \\ &\leq \sum_{q' > q - N_0} \|\Delta_{q'} u_3\|_{L^2} \|\partial_3 \Delta_{q''} u\|_{L_v^\infty L_h^4} \|\Delta_q u\|_{L_v^2 L_h^4}. \end{aligned}$$

Using Proposition 6.1 and Lemma 2.4, we infer

$$\begin{aligned}\|\Delta_{q'} u_3\|_{L^2} &\leq 2^{-q'} \|\Delta_{q'} \nabla u_3\|_{L^2} \\ &\leq 2^{-q'} \|\Delta_{q'} \nabla_h u_3\|_{L^2} \\ &\leq 2^{-q'} 2^{-q' s} c_{q'} \|\nabla_h u\|_{H^s},\end{aligned}$$

$$\begin{aligned}\|\partial_3 \Delta_{q''} u\|_{L_v^\infty L_h^4} &\leq 2^{q''} \|u\|_{L_v^\infty L_h^4} \\ &\leq 2^{q''} \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2},\end{aligned}$$

and

$$\|\Delta_q u\|_{L_v^2 L_h^4} \leq 2^{-qs} c_q \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{1/2}.$$

Finally

$$|\mathcal{R}^{v,q}| \leq 2^{-2qs} b_q \|u\|_{L_v^\infty L_h^2}^{1/2} \|\nabla_h u\|_{L_v^\infty L_h^2}^{1/2} \|u\|_{H^s}^{1/2} \|\nabla_h u\|_{H^s}^{3/2}.$$

The proof of Lemma 3.1 is completed. ■

7. APPENDIX

This section is devoted to the proofs of some technical lemmas stated in the second section. Note that the proofs of such results are contained in several papers (see for instance [5, 26, 27]). Here we give them for the convenience of the reader.

Proof of Bernstein Lemma 2.3.

Let $\tilde{\mathcal{C}}$ be a ring such that $\mathcal{C} \subset \tilde{\mathcal{C}}$ and ϕ be a smooth compactly supported function in $\tilde{\mathcal{C}}$, whose value is 1 near $\mathcal{C}$. Since $\text{supp } \mathcal{F}u \subset 2^q \mathcal{C}$, we infer

$$\mathcal{F} \Delta_q u(\xi) = \phi(2^{-q} \xi) \mathcal{F} \Delta_q u(\xi) = \sum_{i=1,3} \frac{\phi_i(2^{-q} \xi)}{\xi_i} \widehat{\partial_{x_i} \Delta_q u}(\xi),$$

where $\phi(\xi) = \sum_{i=1,3} \phi_i(\xi)$ is such that $\xi_i \neq 0$ on the support of ϕ_i . If we set $\psi_i(\xi) = \phi_i(\xi)/\xi_i$, then $\psi_i \in C_0^\infty(\mathbb{R}^3)$, has the support in $\mathcal{C}$ and

$$\mathcal{F} \Delta_q u(\xi) = 2^{-q} \sum_{i=1,3} \psi_i(2^{-q} \xi) \widehat{\partial_{x_i} \Delta_q u}(\xi).$$

We denote by h the rapidly decaying function such that $\mathcal{F} h_i = \psi_i$. Therefore

$$\Delta_q u(x) = 2^{-q} 2^{3q} \sum_{i=1,3} h_i(2^q \cdot) * \partial_{x_i} \Delta_q u(x).$$

From this equality, we easily deduce that

$$\|\Delta_q u\|_{L_h^p(L_v^r)} \leq C 2^{-q} \sum_{i=1,3} \|2^{3q} h_i(2^q \cdot)\|_{L^1} \|\partial_{x_i} \Delta_q u\|_{L_h^p(L_v^r)}$$

and so

$$\|\Delta_q u\|_{L_v^r(L_h^p)} \leq C 2^{-q} \|\nabla \Delta_q u\|_{L_v^r(L_h^p)}.$$
■

Proof of Lemma 2.1.

We introduce the function $h_j(x) = 2^{3j}h(2^jx)$, where $h \in \mathcal{S}(\mathbb{R}^3)$ is such that $\mathcal{F}(h) = \varphi \in C_0^\infty(\mathbb{R}^3)$. Let

$$\begin{aligned} u_j(x) := \Delta_j u(x) &= \int_{\mathbb{R}^3} h_j(x-y)u(y)dy \\ &= \int_{\mathbb{R}^3} h_j(x_h - y_h, x_v - y_v)u(y_h, y_v)dy_h dy_v \\ &= \int_{\mathbb{R}} \left(\int_{\mathbb{R}^2} h_j(x_h - y_h, x_v - y_v)u(y_h, y_v)dy_h \right) dy_v \\ &= \int_{\mathbb{R}} (h_j(\cdot, x_v - y_v) *_{x_h} u(\cdot, y_v))(x_h)dy_v. \end{aligned}$$

Then

$$\|u_j(\cdot, x_v)\|_{L_h^r} \leq \int_{\mathbb{R}} \|h_j(\cdot, x_v - y_v) *_{x_h} u(\cdot, y_v)\|_{L_h^r} dy_v.$$

By the Young inequality, we get

$$\|h_j(\cdot, x_v - y_v) *_{x_h} u(\cdot, y_v)\|_{L_h^r} \leq \|h_j(\cdot, x_v - y_v)\|_{L_h^1} \|u(\cdot, y_v)\|_{L_h^r}$$

and so

$$\begin{aligned} \|u_j(\cdot, x_v)\|_{L_h^r} &\leq \int_{\mathbb{R}} \|h_j(\cdot, x_v - y_v)\|_{L_h^1} \|u(\cdot, y_v)\|_{L_h^r} dy_v \\ &= \left(\|h_j(\cdot, \cdot)\|_{L_h^1} *_{x_v} \|u(\cdot, \cdot)\|_{L_h^r} \right) (x_v). \end{aligned}$$

Now, we take the L_v^p norm in the above inequality to obtain

$$\left\| \|u_j(\cdot, x_v)\|_{L_h^r} \right\|_{L_v^p} \leq \left\| \|h_j(\cdot, \cdot)\|_{L_h^1} \right\|_{L_v^1} \left\| \|u(\cdot, \cdot)\|_{L_h^r} \right\|_{L_v^p}.$$

Finally

$$\|\Delta_j u\|_{L_v^p L_h^r} \leq \|h\|_{L^1(\mathbb{R}^3)} \|u\|_{L_v^p L_h^r}.$$

■

Proof of Lemma 2.2.

We will prove here, that, for all $p, r, s, t \geq 1$ such that $\frac{1}{r} = \frac{1}{s} + \frac{1}{t}$, we have

$$\|[\Delta_q; a]b\|_{L_v^p L_h^r} \leq C2^{-q} \|\nabla a\|_{L_v^\infty L_h^s} \|b\|_{L_v^p L_h^t}.$$

We begin by writing the commutator in the following form

$$\begin{aligned}
[\Delta_q; a]b(x) &= 2^{3q} \int_{\mathbb{R}^3} h(2^q y) (a(x-y) - a(x)) b(x-y) dy \\
&= -2^{3q} \int_{\mathbb{R}^3} h(2^q y) \int_0^1 y \nabla a(x - \tau y) d\tau b(x-y) dy \\
&= -2^{3q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} h(2^q y) y_i (\partial_i a)(x - \tau y) b(x-y) dy d\tau \\
&= 2^{-q} 2^{3q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} h_i(2^q y) \cdot (\partial_i a)(x - \tau y) b(x-y) dy d\tau,
\end{aligned}$$

where $h_i(z) = h(z)z_i$. We take the L_h^r norm in the horizontal variable and we apply the Hölder inequality to obtain

$$\begin{aligned}
\|[\Delta_q; a]b(\cdot, x_v)\|_{L_h^r} &\leq 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \|(\partial_i a)(\cdot - \tau y_h, x_v - \tau y_v) b(\cdot - y_h, x_v - y_v)\|_{L_{x_h}^r} dy d\tau \\
&\leq 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \|(\partial_i a)(\cdot - \tau y_h, x_v - \tau y_v)\|_{L_{x_h}^s} \|b(\cdot - y_h, x_v - y_v)\|_{L_{x_h}^t} dy d\tau \\
&= 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \|\partial_i a(\cdot, x_v - \tau y_v)\|_{L_h^s} \|b(\cdot, x_v - y_v)\|_{L_h^t} dy d\tau.
\end{aligned}$$

We take now the L_v^p norm in the vertical variable and we obtain

$$\begin{aligned}
\|[\Delta_q; a]b\|_{L_v^p L_h^r} &\leq 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \|(\partial_i a)(\cdot, x_v - \tau y_v)\|_{L_h^s} \|b(\cdot, x_v - y_v)\|_{L_h^t} \|L_{x_v}^p\| dy d\tau \\
&\leq 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \sup_{x_v} \|\partial_i a(\cdot, x_v - \tau y_v)\|_{L_{x_h}^s} \|b(\cdot, x_v - y_v)\|_{L_{x_h}^t} \|L_{x_v}^p\| dy d\tau \\
&= 2^{-q} \int_{\mathbb{R}^3 \times [0,1]} \sum_{i=1,3} 2^{3q} |h_i(2^q y)| \|\partial_i a\|_{L_v^\infty(L_h^s)} \|b\|_{L_v^p(L_h^t)} dy d\tau \\
&= 2^{-q} \|\nabla a\|_{L_v^\infty L_h^s} \|b\|_{L_v^p(L_h^t)} \|h_i\|_{L^1(\mathbb{R}^3)}.
\end{aligned}$$

This leads to

$$\|[\Delta_q; a]b\|_{L_v^p(L_h^r)} \leq C 2^{-q} \|\nabla a\|_{L_v^\infty(L_h^s)} \|b\|_{L_v^p L_h^t}.$$
